

FRESCOLORI *Big Facts*

An almost inexhaustible and fascinating variety of colors

Over 100.000 hues of color have been programmed to be created with the newly developed mixing-unit. Likewise with the natural and valuable powderpigments the materials (the plaster) are toned. This yields a lively versatility and variety in the most beautiful colors of the world!

400 structures and textures

Through additives of most diverse sort and size, and the many differentiated techniques of application, over 400 alternative surfacestructures can be realized with the few miscellaneously grained, basic marbleplaster products. And constantly new possibilities are determined and discovered, to become an animating viewing experience on any new surface.

The FRESCOLORI principle of creativity

Aided by an ingenious range of products, that in application offers most diverse options, the processor with his personal creativity and craftsmanship again becomes the originator of unique surfaces. Thus among the most creative a distinct dynamic of the possible is developed. Being living FRESCOLORI !

Ecological, environment-friendly

The FRESCOLORI limeproducts are made from over 95% of natural substances. The formulas are steadily monitored and examined. Being conscious of a great responsibility, mankind, nature and environment are sensitively accounted to.

Open to steam diffusion (breathable)

The surfaces of FRESCOLORI plaster are open to steam diffusion, which means that water in the form of steam can be absorbed, buffered and released again. A perceptibly agreeable, moisture balanced, healthy indoor climate is formed, noticeably raising the quality of living.

Durable, robust and economic

The quality and the elaborated formula of the lime-products and the carefully selected ingredients warrant a long preservability.

Moreover, FRESCOLORI surfaces possess a fascinating and excellent final hardness, which fundamentally benefits the wear-resistance. To be enchantfully experienced in daily use.

And FRESCOLORI-surfaces are reworkable any time. Thus the economic factor is lastingly accounted for.

Ready-for-use and yielding

FRESCOLORI surfacers are filled in containers ready for use, granting the processor security. Practically any contemporary subsurface, like all different kinds of plaster, gypsumboard, wood, MDF, concrete, etc, can be processed with the FRESCOLORI-concept into new, gorgeous surfaces.

As the construction thickness of 0.1-0.7mm per layer yields very little consumption of material, a considerable economy of time is the result.

Processing

The processing is in principle a simple manual technique, analogous to the historic fresco method: Apply the (first) layer and spread appropriate to grain, wait (restphase) for surface drying (probe with hand), dampen and manually polish to the aspired surface-finish. The material captivates by the length of time in which it can be processed, so that there is always ample time for adaption and the finishing polish – the great advantage of the ingenious formula. Every surface is characterized by the creativity of performance and craftsmanship of the processor. Unique specimens are created. The final hardness of the surface is arrived at the next day.
